<u>Comment on this article</u>

Abstract: Translating linear temporal logic formulas to automata has proven to be an effective approach for implementing linear-time model-checking, and for obtaining many extensions and improvements to this verification method. On the other hand, for branching temporal logic, automata-theoretic techniques have long been thought to introduce an exponential penalty, making them essentially useless for model-checking. Recently, Bernholtz and Grumberg have shown that this exponential penalty can be avoided, ... <u>(Update)</u>

automata-theoretic model checking

Kousha Etessami

Bell Labs

(starting next week, my affiliation will be *U. of Edinburgh*)

overview

- The purpose of my lectures:
  - to cover the fundamental algorithms used in the **automata**-theoretic approach to (LTL) **model checking**, as practiced in tools such as SPIN.
